

Application of Joints and Springs in ANSYS

Introduction

This tutorial was created using ANSYS 5.7.1. This tutorial will introduce:

- the use of multiple elements in ANSYS
- elements COMBIN7 (Joints) and COMBIN14 (Springs)
- obtaining/storing scalar information and store them as parameters.

A 1000N vertical load will be applied to a catapult as shown in the figure below. The catapult is built from steel tubing with an outer diameter of 40 mm, a wall thickness of 10, and a modulus of elasticity of 200GPa. The springs have a stiffness of 5 N/mm.
